# Half Flip 6D Lattice 

R. B. Palmer, Rick Fernow (BNL)

Thursday
2/14/13

- Introduction
- lattice types
- Parameters of Half-Flip lattices
- ICOOL simulation using matrices
- Conclusion

Cooling Scheme

## RFOFO Flip

Bo $11.66 \max$ Bs 15.0411 .49 maxRBJs 260.8310 .0 Brf 10.0

Non-Flip

Rick: this has no stable orbits, unless very little bending

Half Flip

no tilt/ tilt

- Without bending all cells have identical focusing ( $\propto B^{2}$ )
- With bending (Guggenheim), or coil tilting (Balbakov) the symmetry is broken and a resonance exists in the center of the pass band
- But the coil tilts are very small and this resonance may not be too bad

|  | $\begin{gathered} \beta \\ \mathrm{cm} \end{gathered}$ | $\begin{aligned} & \hline \text { cell } \\ & \text { cm } \end{aligned}$ | $\begin{gathered} \mathrm{L} \\ \mathrm{~cm} \end{gathered}$ | $\begin{aligned} & \mathrm{dL} \\ & \mathrm{~cm} \end{aligned}$ | $\begin{gathered} \mathrm{R} \\ \mathrm{~cm} \end{gathered}$ | $\begin{aligned} & \mathrm{dR} \\ & \mathrm{~cm} \end{aligned}$ | $\begin{gathered} \mathrm{j} \\ A / m m^{2} \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 70 | 5.2 | 68.75 | 3.000 | 28.000 | 18.000 | 15.000 | 117.26 |
| 71 | 4.6 | 68.75 | 0.000 | 29.000 | 18.000 | 15.000 | 105.77 |
| 72 | 3.9 | 68.75 | 0.000 | 13.000 | 12.000 | 15.000 | 96.80 |
|  |  |  | 13.000 | 16.000 | 18.000 | 15.000 | 96.85 |
| 74 | 2.9 | 58 | 4.218 | 8.436 | 5.905 | 21.091 | 158.14 |
|  |  |  | 12.655 | 6.327 | 19.404 | 7.593 | 134.22 |
| 76 | 2.1 | 58 | 1.687 | 10.967 | 4.218 | 16.873 | 153.79 |
| 77 | 1.6 | 58 | 0.000 | 10.967 | 4.218 | 16.873 | 158.75 |

- locations and dimensions are symmetric left-right in each cell
- currents are reversed left-right in each cell
- when there are two lines for one file, there are two coils per half cell
$j$ vs $B$ for required 3 cm betas
RFOFO flip magenta
Half flip lattices red shorter blue longer
Non-flip black
60\% YBCO good direction

- Half flip design uses less fields on coils than Non-flip but its cells are longer
- They are now ok for both $\mathrm{Nb}_{3} \mathrm{Sn}$ and YBCO in the bas direction
- In addition, the field lines are more axial than in the flip lattice
j vs B extended to lower betas

| RFOFO flip | magenta |  |
| :--- | :--- | :--- |
| Half flip lattices | red shorter | blue longer |
| Non-flip | black |  |

- Half flip solution probably ok to 1.6 cm with longer cells
- This should cool to $150 \mu \mathrm{~m}$ for the enhanced performance goal

ICOOL using matrices for half-flip with longer cells

- Performance should be a little better with shorter cells
- And this has not been optimized yet

## Conclusion

|  |  |  | $\epsilon_{\perp}=240 \mu \mathrm{~m}$ |  |  | $\epsilon_{\perp}=150 \mu \mathrm{~m}$ |  |  |
| :---: | :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| case | files |  | Len | $\epsilon_{\\|}$ | Trnsm. \% | Len | $\epsilon_{\\|}$ | Trnsm. \% |
| 1 | tap16a0 | RFOFO | 470 | 2.1 | 47.3 |  |  |  |
| 3 | tap16a5v | Non-flips | 375 | 2.1 | 53.7 | 471 | 2.15 | 46.2 |
| 3 | tap16a5x | Half flips | 410 | 1.98 | 46.2 | 510 | 1.91 | 31.6 |

- Half-Flip lattice meets current density requirements
- And meets minimum cooling requirements ( $240 \mu \mathrm{~m}$ )
- More losses than Non-Flip
- But about the same as original RFOFO Flip lattices
- Even meets extended cooling requirement ( $150 \mu \mathrm{~m}$ )
- But with more losses than Non-Flip
- But may have additional losses from resonance in center of acceptance if bending one way
- Rick: Simple coil tilts did not give enough dispersion
- Perhaps the Valeri Balbakov version would allow more flexibility in the generation of dispersion
- Needs real simulation with/without Balbakov modification
