

LUMINOSITY :* \mathcal{L} is defined as the interaction event rate per unit of elementary cross section

$$\# \text{events rate} = \sigma_{\text{elem.}} \mathcal{L}$$

A typical value of cross section in e^+e^- annihilation is set by the point cross section (s center of mass energy)

$$1R = \frac{4\pi\alpha^2}{3s} \equiv \frac{86.8[\text{fb}]}{s[\text{TeV}^2]}$$

It is reasonable to set a luminosity of 1.5×10^4 events per R per year at 1 TeV, then

$$\mathcal{L}[cm^{-2}s^{-1}] \approx 5.5 \times 10^{33} [cm^{-2}s^{-1}] \left(\frac{E_{eff}[\text{TeV}]}{1[\text{TeV}]} \right)^2$$

Notice :

$$\text{Hadron collider } E_{eff} \approx \frac{E_{c-of-m}}{10}$$

$$\text{Lepton collider } E_{eff} = E_{c-of-m}$$
