The Goal: Intense Secondary Beams

World-wide interest in exploring new physics opportunities via intense new beams

- Kaons
  - Kopio—BNL
  - CKM—FNAL
  - LOI's 4,5,16,19,28 – JPARC
- Neutrons
  - SNS
  - PSI-SINQ
  - JAERI/JPARC
- Neutrinos
    - Numi—FNAL
    - BNL to Homestake
    - T2K – JPARC
    - CNGS—CERN
- Muons
  - g-2 – BNL
  - Meco – BNL
  - Sindrum--PSI
  - Prism- JPARC
  - Neutrino Factory/Muon Collider

Achieving Intense Muon Beams

Maximize Pion/Muon Production

- Soft-pion Production
- High Z materials
- High Magnetic Field

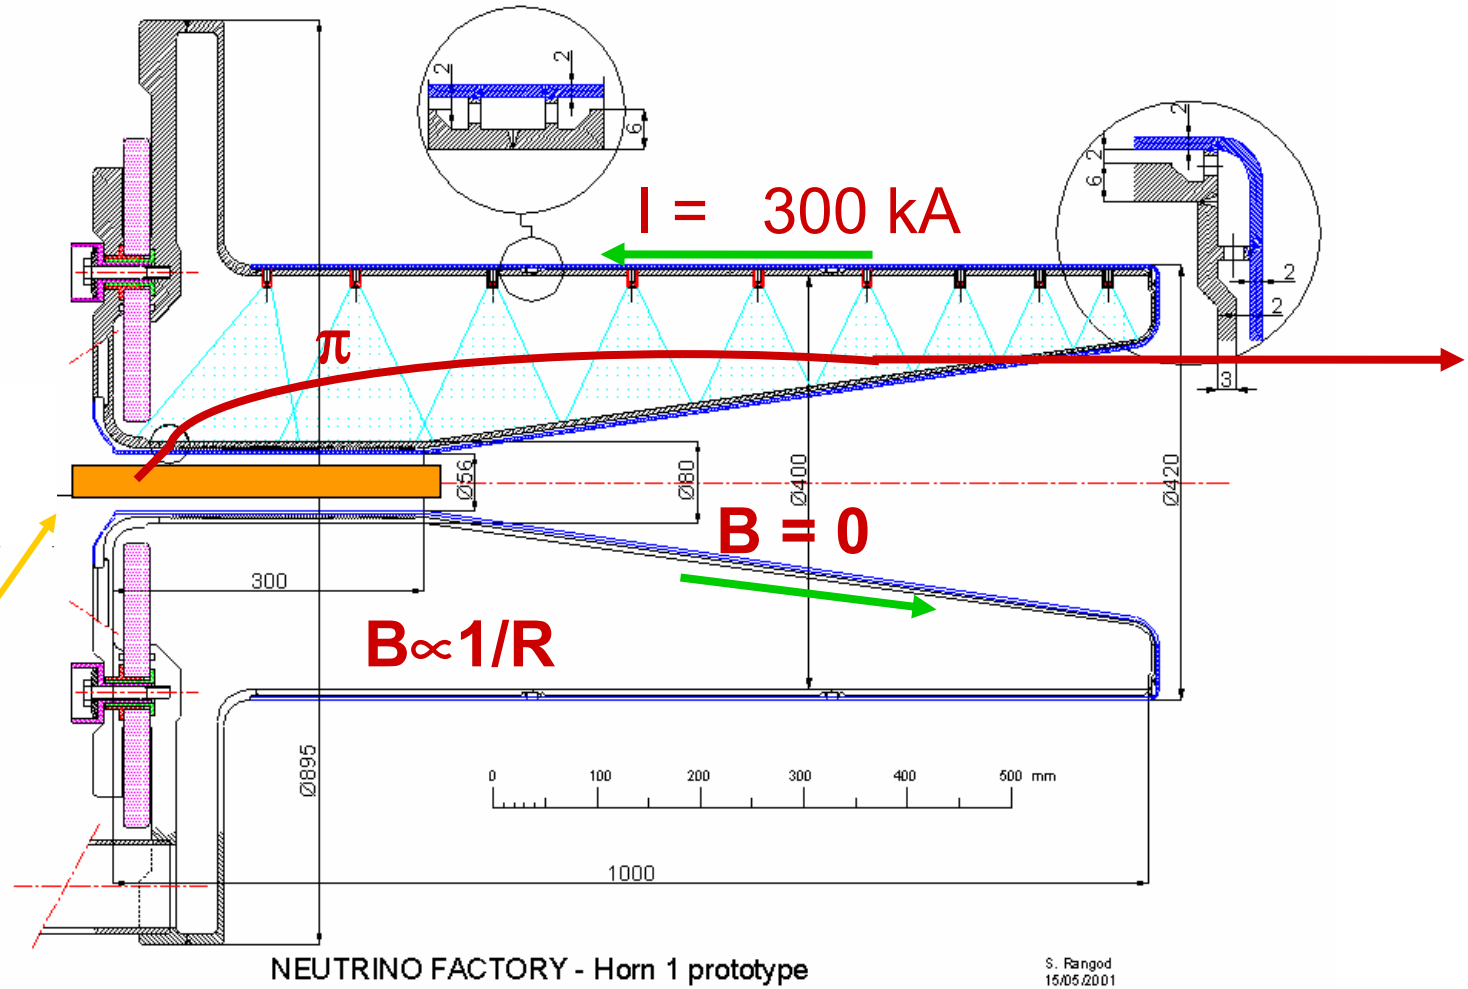
Six 17 TP pulses at an effective 50 Hz rate

The SPL Neutrino Horn

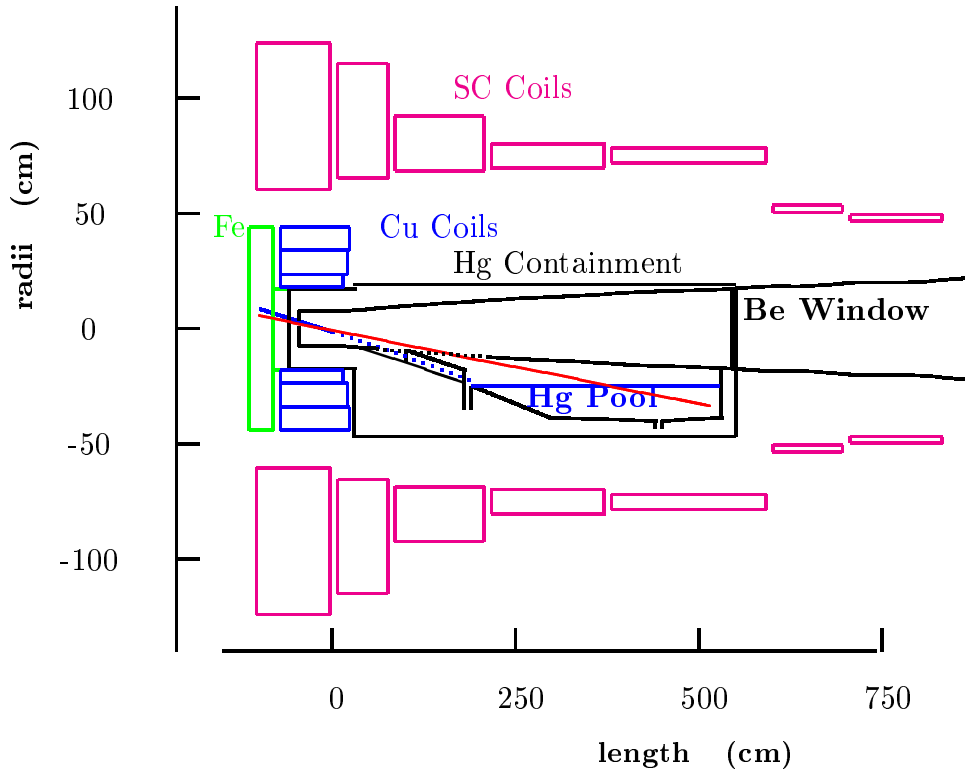
2.2 GeV
at 4MW
50 Hz
operation

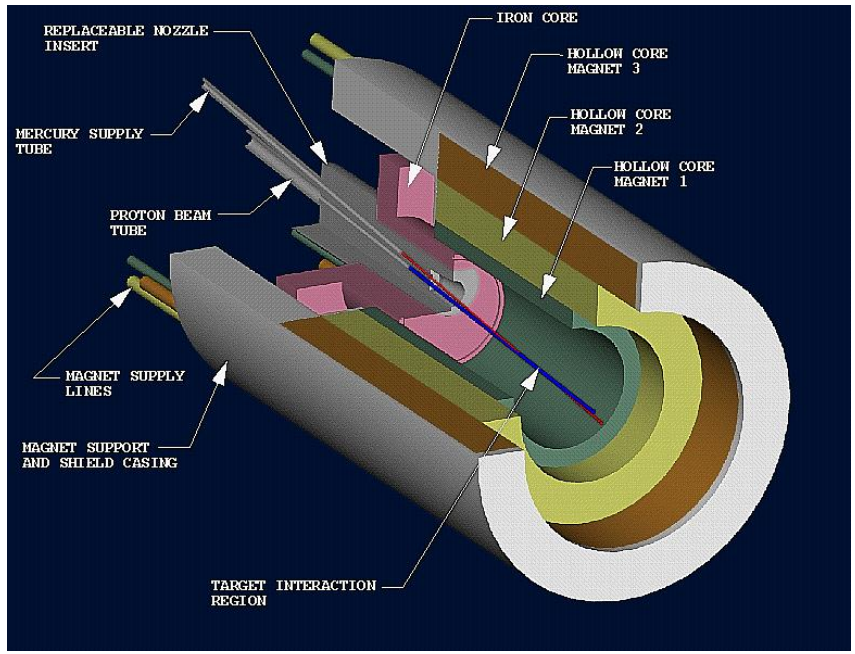
Protons

Hg Jet



Neutrino Factory Targetry Concept



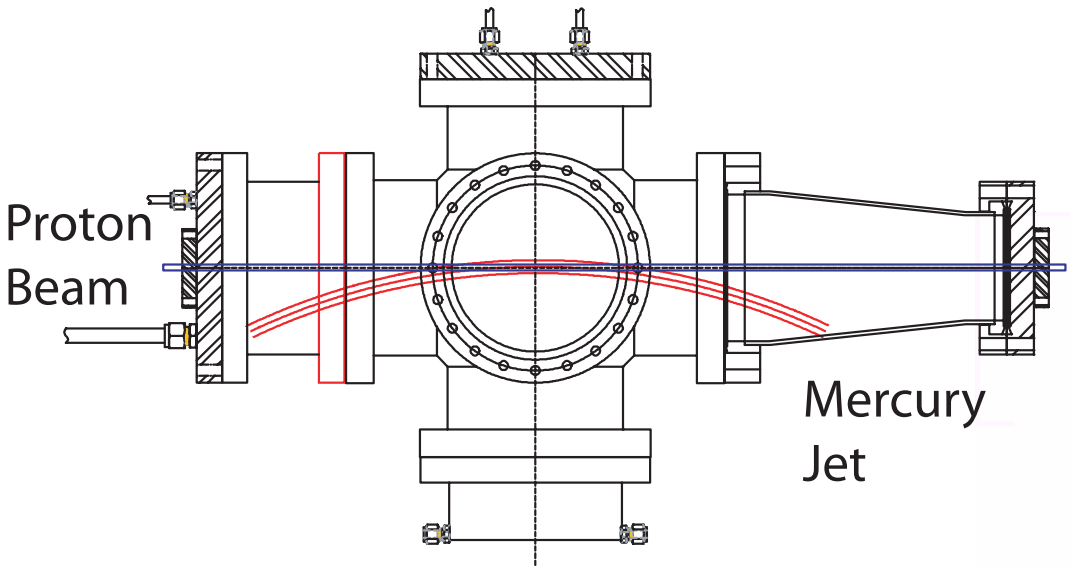


Capture low P_T pions in high-field solenoid
Use Hg jet tilted with respect to solenoid axis
Use Hg pool as beam dump

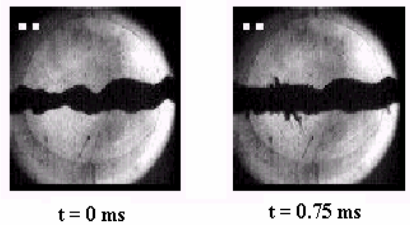
Engineered solution--P. Spampinato, ORNL

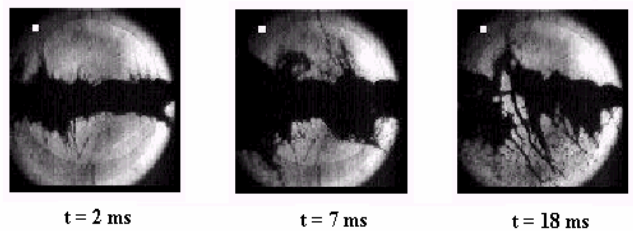
BROOKHAVEN NATIONAL LABORATORY

E951 Hg Jet Tests



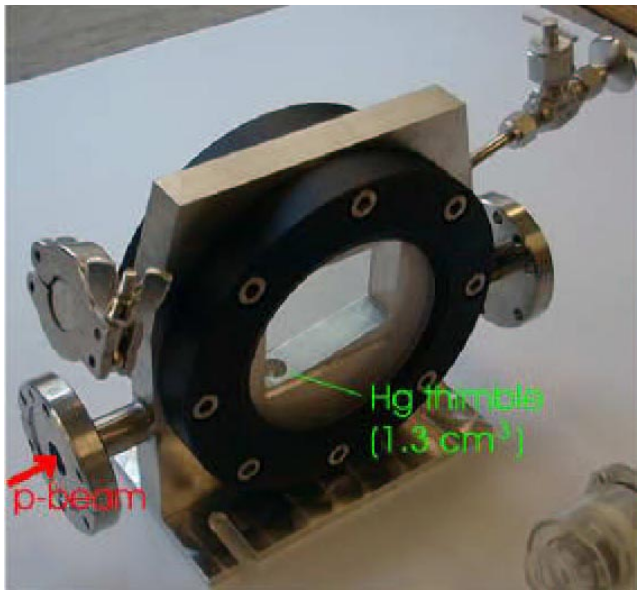
- 1cm diameter Hg Jet
- 24 GeV 4 TP Proton Beam
- No Magnetic Field

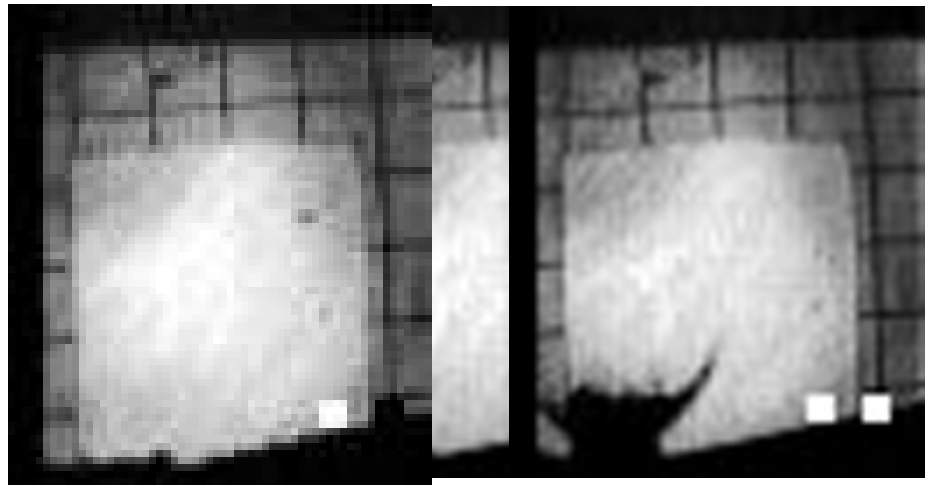


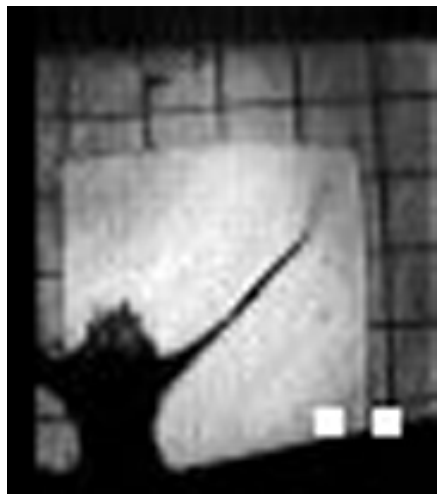


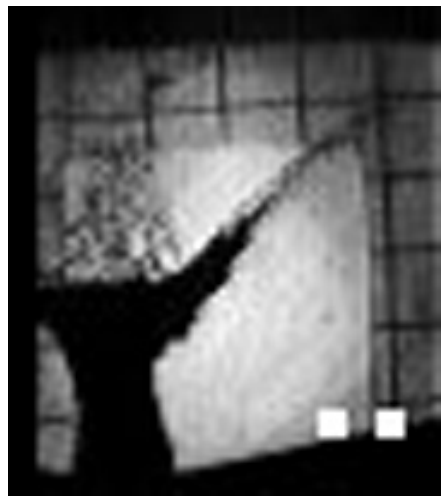
BROOKHAVEN NATIONAL LABORATORY

CERN Passive Hg Thimble Test







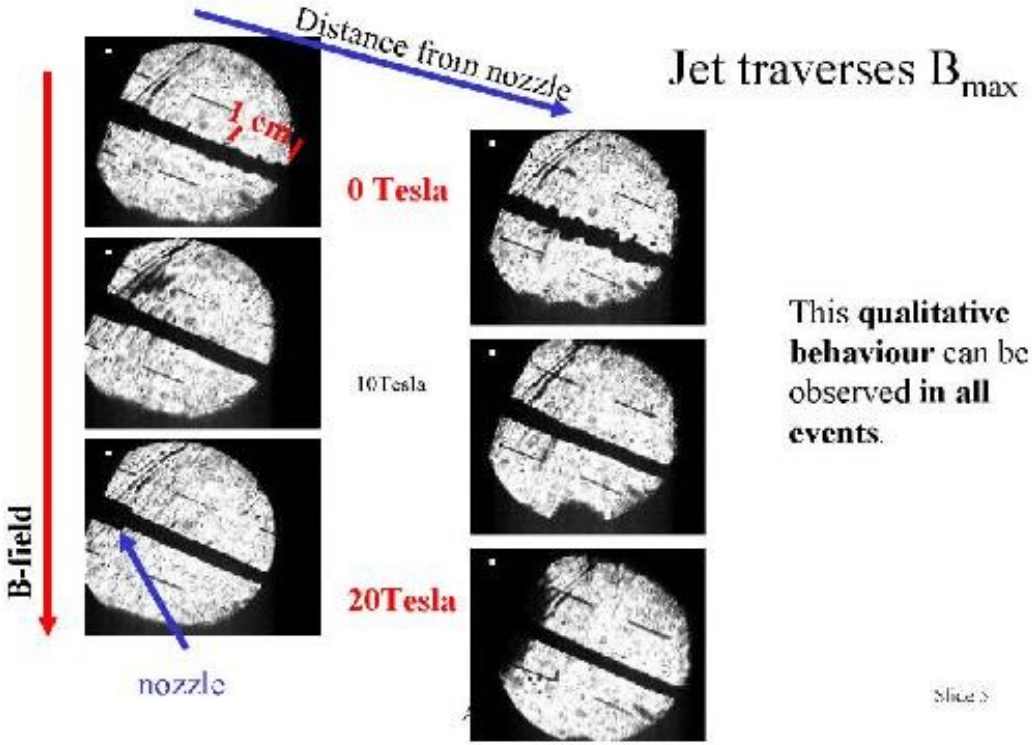


Exposures to a BNL AGS 24 GeV
2 TP beam. T=0, 0.5 , 1.6 and 3.4 ms.

Key E951 Results

- Hg jet dispersal proportional to beam intensity
- Hg jet dispersal ~ 10 m/s for 4 TP 24 GeV beam
- Hg jet dispersal velocities ~ ½ times that of "confined thimble" target
- Hg dispersal is largely transverse to the jet axis -- longitudinal propagation of pressure waves is suppressed
- Visible manifestation of jet dispersal delayed 40 μs

CERN/Grenoble Hg Jet Tests



- 4 mm diameter Hg Jet
- v = 12 m/s
- 0, 10, 20T Magnetic Field
- No Proton Beam

A. Fabich, J. Lettry
Nufact'02

Key Jet/Magnetic Field Results

- The Hg jet is stabilized by the 20 T magnetic field
- Minimal jet deflection for 100 mrad angle of entry
- Jet velocity reduced upon entry to the magnetic field

Bringing it all Together

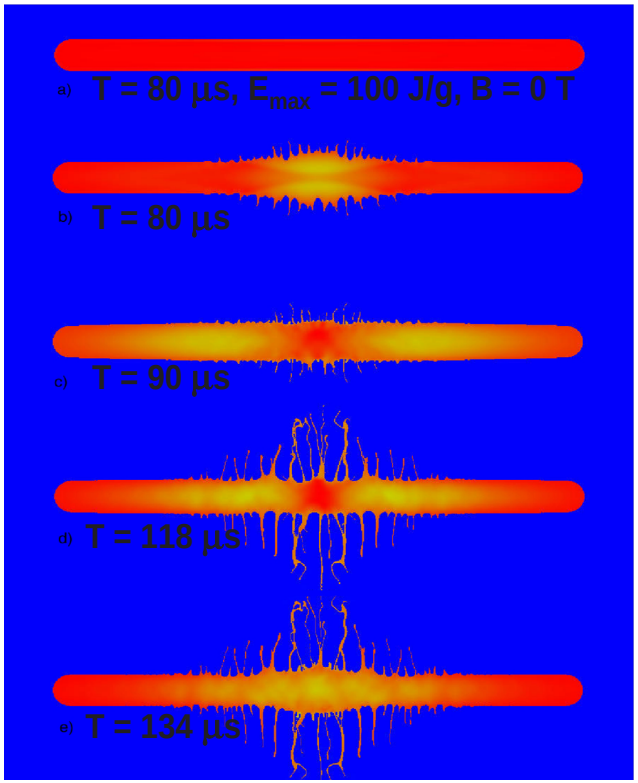
We wish to perform a proof-of-principle test which will include:

- A high-power intense proton beam (16 to 32 TP per pulse)
- A high (> 15T) solenoidal field
- A high (> 10m/s) velocity Hg jet
- A ~1cm diameter Hg jet

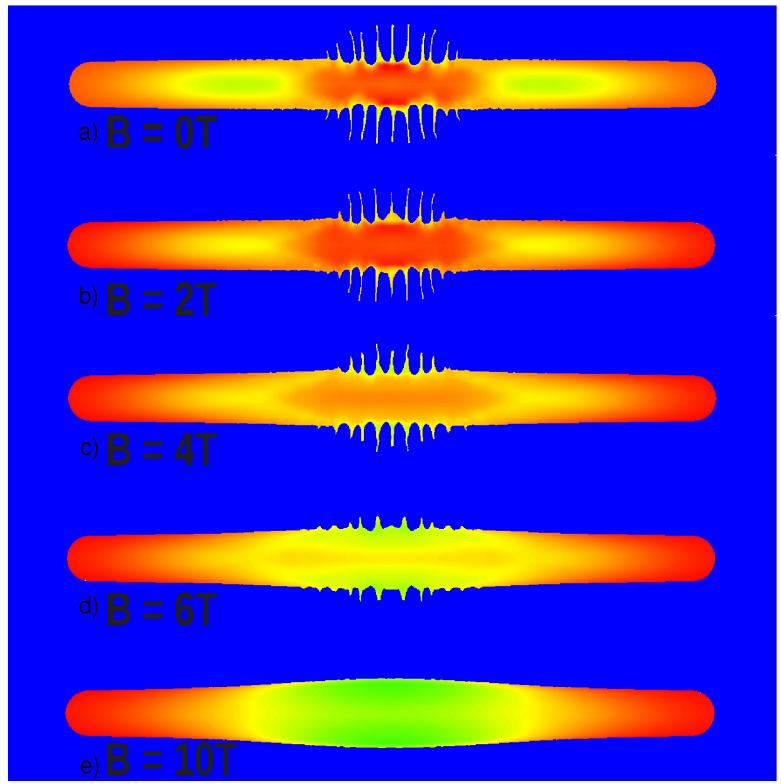
Experimental goals include:

- Studies of 1cm diameter jet entering a 15T solenoid magnet
- Studies of the Hg jet dispersal provoked by an intense pulse of a proton beam in a high solenoidal field
- Studies of the influence of entry angle on jet performance
- Confirm Neutrino factory/Muon Collider Targetry concept

Simulations at BNL (Samulyak)



Gaussian energy deposition profile Peaked at 100 J/g. Times run from 0 to 124 μs.



Jet dispersal at t=100 μs with magnetic Field varying from B=0 to 10T

Geneva, 4th April 2005

Dear Professor Kirk and Professor McDonald,

Concerning your proposal P186 to the INTC (Studies of a Target System for a 4-MW, 24-Gev Proton Beam), I am happy to inform you that following consideration at the meetings of 2 December 2004 and 3 March 2005, the experiment has been approved by the CERN Research Board. It will be known as nTOF11.

Yours sincerely,

J. Engelen

Harold G. Kirk

Profile of the Experiment

- 24 GeV Proton beam
- Up to 28 x 10^{12} Protons (TP) per 2μs spill
- Proton beam spot with r ≤ 1.5 mm rms
- 1cm diameter Hg Jet
- Hg Jet/Proton beam off solenoid axis
  - Hg Jet 100 mrad
  - Proton beam 67 mrad
- Test 50 Hz operations
  - 20 m/s Hg Jet
  - 2 spills separated by 20 ms

PS Beam Characteristics

- PS will run in a harmonic 8 mode
- We can fill any of the 8 rf buckets with 4 bunches at our discretion.
- Each microbunch can contain up to 7 TP.
- Fast extraction can accommodate entire 2μs PS fill.
- Fast kicker capacitor bank recharges in 11 ms
- Extraction at 24 GeV
- Partial/multiple extraction possible at 14 GeV
- Beam on target April 2007

Peak Energy Deposition

Neutrino Factories

Hg target; 1 MW 24 GeV proton beam; 15 Hz

1cm diameter Hg jet ; 1.5mm x 1.5mm beam spot 100 J/g

Hg target; 4 MW 2.2 GeV proton beam; 50 Hz

2cm diameter Hg jet; 3mm x 3mm beam spot 180 J/g

E951

Hg target; 4 TP 24 GeV proton beam;

σ_y=0.3mm x σ_x=0.9mm rms beam spot 80 J/g

CERN PS (projected)

Hg target; 28 TP 24 GeV proton beam

1.2mm x 1.2 mm rms beam spot 180 J/g

Run plan for PS beam spills

The PS Beam Profile allows for:

- Varying beam charge intensity from 5 TP to 28 TP.
- Studying influence of solenoid field strength on beam dispersal (vary B_o from 0 to 15T).
- Study possible cavitation effects by varying PS spill structure (Pump/Probe)
- Study 50 Hz operation.

Cryosytem Layout

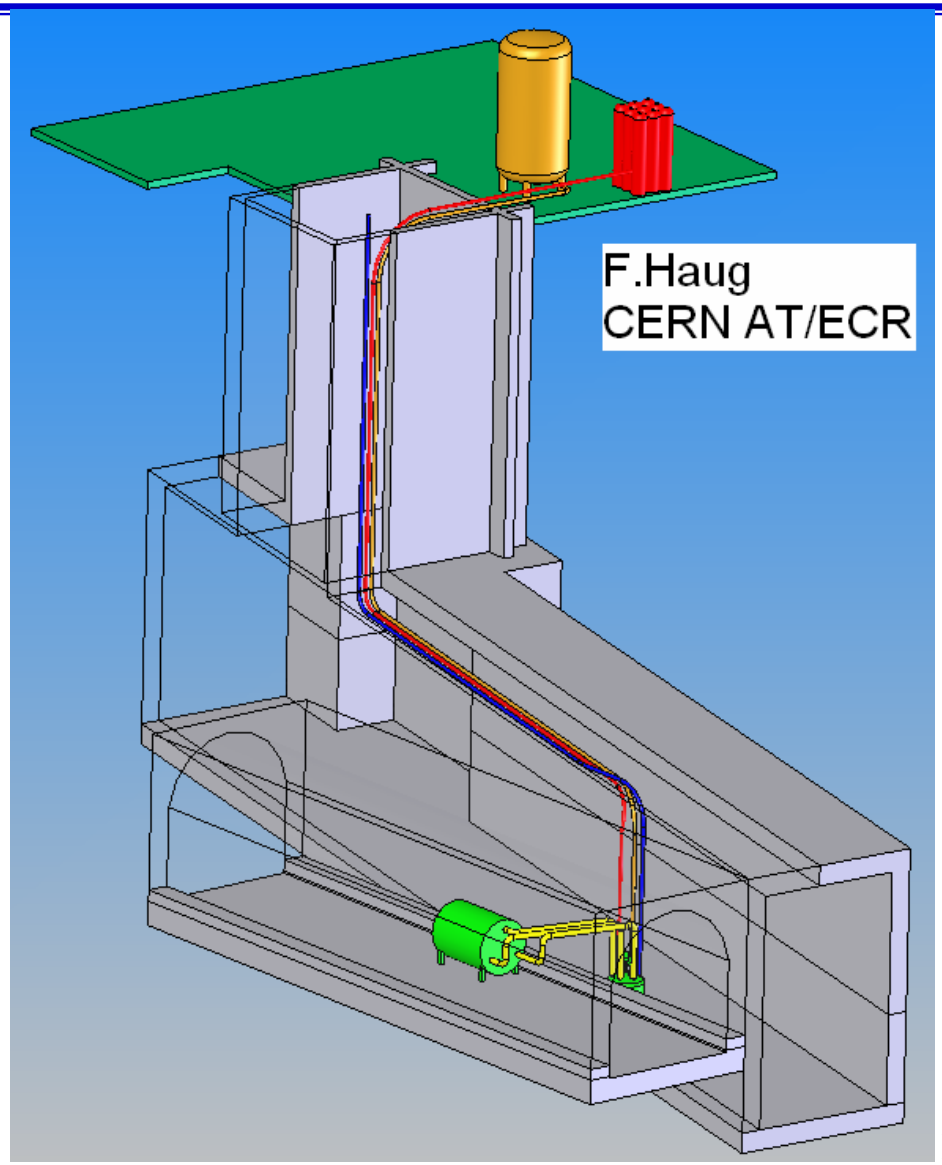
LN_2 and N_2 gas stored on the surface.

Cold valve box in the TT2 tunnel.

Exhaust gas vented into TT10 tunnel through filtration system.

~ 150 liters of LN_2 per Magnet pulse.

Magnet flushed with N_2 prior to each pulse, to minimize activation of N_2.



Power Converter (From SPPS Transfer Line)

8000 Adc, 1000 Vdc

Strategy:

- ***Refurbishment of the West Area Power Converter, making it compatible with the project requirements***

BROOKHAVEN NATIONAL LABORATORY

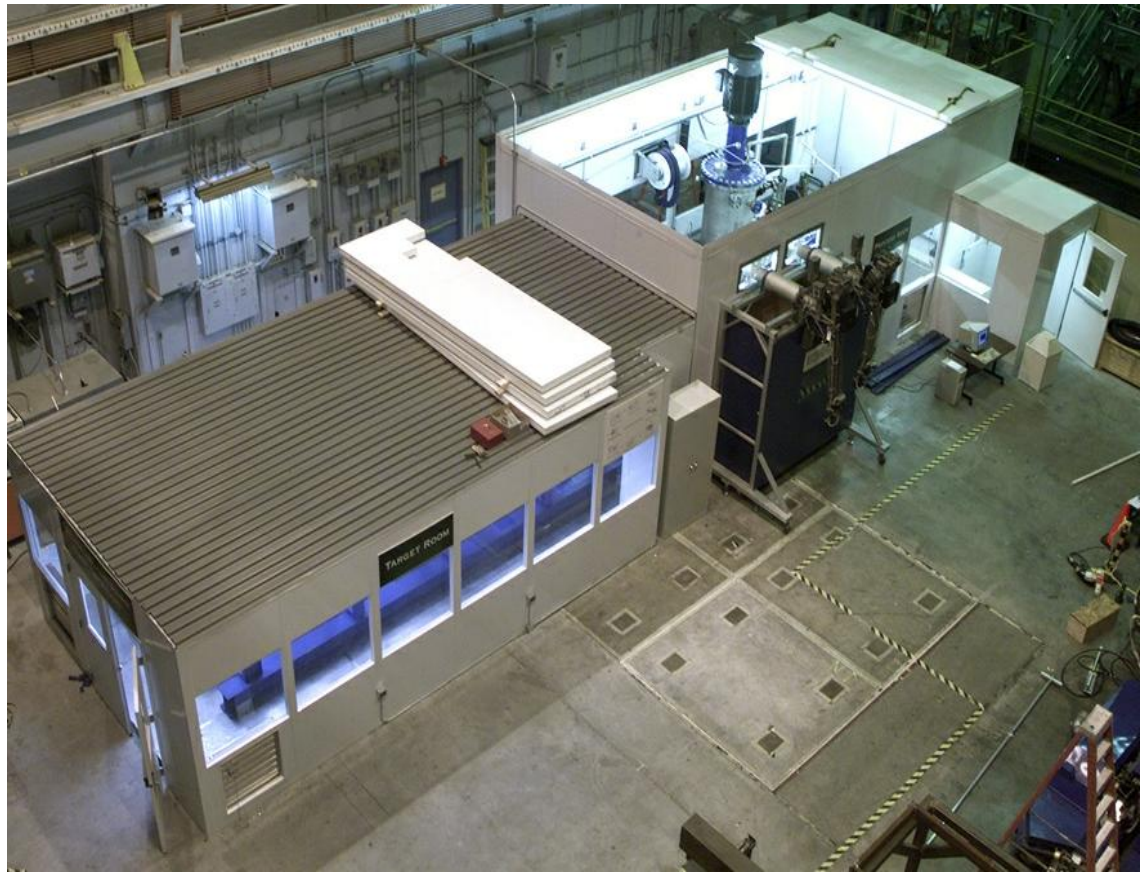
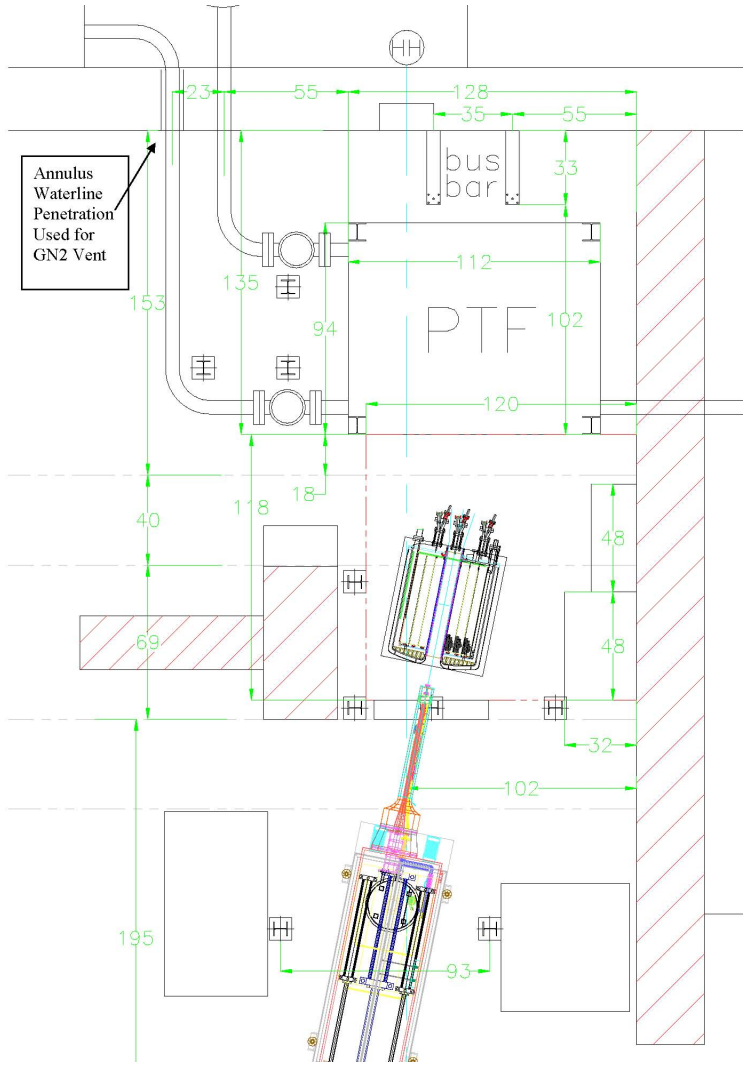
The Target Test Facility (TTF) - Basis For ORNL's Hg Handling Experience

- Full scale, prototype of SNS Hg flow loop
- 1400 liters of Hg
- Used to determine flow characteristics
- Develop hands on operating experience
- Assess key remote handling design issues



System Commissioning

- Ship Pulsed Solenoid to MIT
October 2005
- Test Solenoid to 15 T peak field
November 2005
- Integration of Solenoid/Hg Jet system
Summer 2006



Target Experiment Milestones

Pulsed Solenoid Delivery	October, 2005
Pulsed Solenoid at 15T	November, 2005
Hg Jet Commisioning	Spring, 2006
Solenoid/Hg Jet Integration	Summer, 2006
Cryo System test	Summer, 2006
The Power Supply Commissioning	Fall, 2006
Target Delivery to CERN	Fall, 2006
Experiment Commissioning	Winter, 2006/2007
Beam on Target	April, 2007

Summary

The nTOF11 (MERIT) Experiment

- Study single beam pulses with intensity up to 28TP
- Study influence of solenoid field strength on Hg jet dispersal (B_o from 0 to 15T)
- Study 50 Hz operations scenario
- Study cavitation effects in the Hg jet by varying PS spill structure—Pump/Probe
- First beam expected April 2007
- **Confirm Neutrino Factory targetry concept**
